

Vice Versa

Oracular's OneWorld® Developer Toolkit:

ViceVersa provides J.D. Edwards® OneWorld® developers a software revisioning, remote development and software transportability tool to aid in the management of the software development process. This tool allows users to extend the capabilities of traditional OneWorld® object management.

You need ViceVersa to:

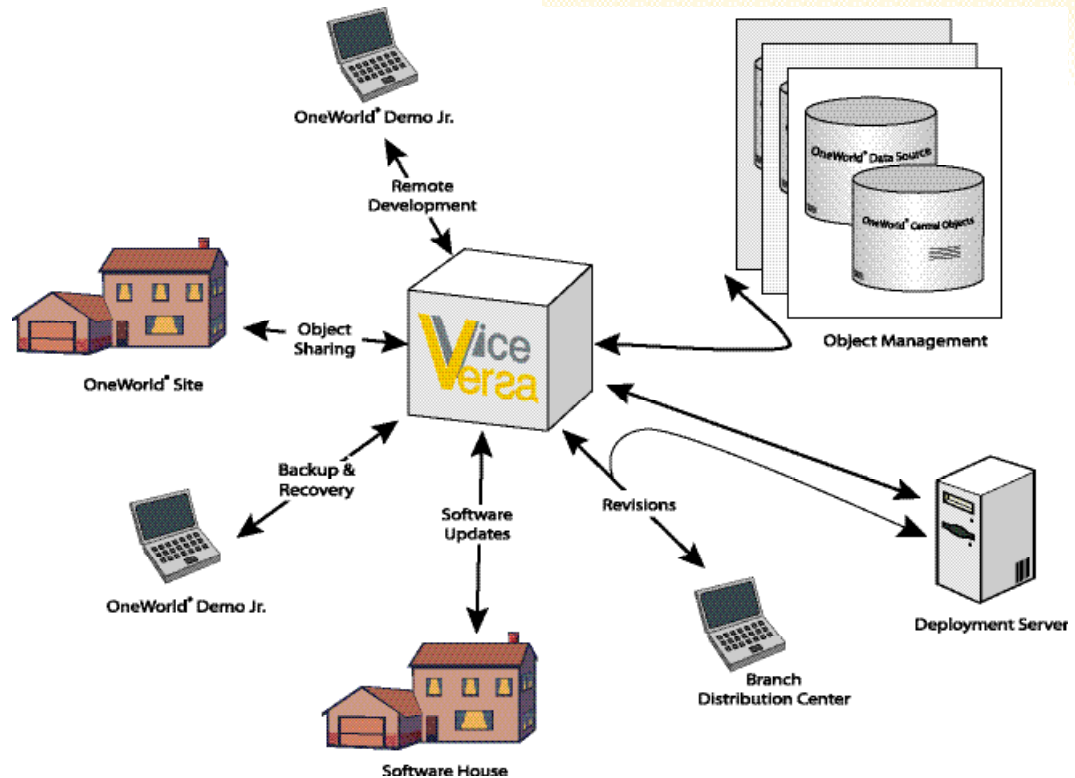

- Reduce the risk you take with losing valuable development time
- Provide recovery of modified production programs to get your system back up and operational
- Reduce travel expenses for solution partners by e-mailing program modifications
- Provide your staff means to perform modifications at home or off site

Protect your development investment and share it across your OneWorld® enterprise

Ensure your developers don't have to rewrite even one line of code. Give them ViceVersa to quickly save their programming efforts before attacking their next challenge. In addition, give your staff and solution partners the availability to develop OneWorld® solutions off-site. Gone are the days of local development requirements and lost programming efforts.

ViceVersa features:

- Rapidly restore backups when newly deployed applications are defective
- Deploy your customized OneWorld® environment to any platform (including Demo Jr®)
- Provide remote development without direct system access
- Manage remote development environments through simple import and export technology
- Quick and easy installation
- Accessible through both client and server solutions
- Minimal client and server system footprint

Revisioning Tool

Keeps an endless number of backups of code and configuration settings. No longer will you apply ESUs, paper fixes, ASUs or CUMs without having a backup of modified objects. You will always have a way to get back to where you are without having to retrace your development teams' steps.

Remote Development

Allows your development team to do development off system and off site. You can even have modifications made and tested on a completely different system. All you have to do is package it and distribute it as you would with any other change.

3rd Party Software Distribution

Develop applications in the J.D. Edwards[®] toolset and have a means of distributing it to your clients. Create your applications, export the specifications and configuration, then use ViceVersa to load it into your client's system on demand (not necessarily compatible across releases).

Technology Behind ViceVersa

ViceVersa uses SQL calls, same as OneWorld[®], to read from and write data to OneWorld[®] Data sources. During the backup, ViceVersa exports data in a propriety format and stores it on the local disk. This can later be imported back into any compatible OneWorld[®] release. ViceVersa fully exploits the relational database that OneWorld[®] is built on and extends the native functionality in OneWorld[®].

Oracular is a premiere provider of professional Information Technology services, specializing in implementing customer-centric business solutions. We can help you increase the velocity of your business decisions through a comprehensive, flexible suite of services designed to compliment your business processes. Start a relationship with a partner who shares your desire for excellence and has the power to revolutionize your business.

Developed exclusively for J.D. Edwards OneWorld[®]

ViceVersa functionality:

- Transportability of objects from one site or system to another
- Import and export capability
- Ability to e-mail exported objects to another OneWorld[®] environment for import
- Unlimited revisions of any object in any environment
- Restoration of any object to a previous revision
- Able to deploy soft code (menus, versions, UDC's, etc.) through backup/restore
- Multiple backup/restore set options including individual or group objects
- Backup sets include both time/date stamp and comments feature
- Automatic revision management with your OneWorld[®] Deployment Server
- Supports all OneWorld[®] object types (excluding media objects)
- Accessible through OneWorld[®] browser and adopts OneWorld[®] security
- Compatible with all OneWorld[®] environments
- GUI interface with drag and drop functionality

Compatible Operating Server Platforms
IBM[®] AS/400, UNIX

Compatible Operating Client Platforms
Microsoft[®] Windows[®] 95, 98, ME, NT, 2000

Compatible Databases
DB2[®], Oracle[®], Microsoft[®] SQL[®]
